

Unit - 1

INTRODUCTION

* Signals:

Signal is a function of one or more independent variable along with information. $f(x_1, x_2, x_3, \dots, x_n)$.

A function of one independent variable is called one dimensional signal and a function of more than one independent variable is called multidimensional signal.

Examples

1. Electrical Signal: One dimensional signal $\rightarrow f(t)$
voltage: $v(t)$
current: $i(t)$
2. Photograph / Image Signal: Two dimensional signal: $f(x, y)$
image: $I(R, C)$ R: row and C: column
3. Video Signal: Three dimensional signal: $f(x, y, z)$
video: $V(R, G, B)$ Illuminance, Chrominance, Brightness
4. Biomedical Signal:
ECG, EEG, EMG etc.

* Systems:

A system is any process that produces an output signal in response to an input signal.

Ex: Communication systems, control system, Biomedical systems.

Ex: Block diagram of basic communication system

Source: Mic

Transmitter: Antenna / Modulator

Medium: Wired / Wireless

Receiver: Antenna / Demodulator

Destination: Speaker

Filter can be used
on the output side to
remove noise.

* Classification of signals:

a. Continuous Time Signal or Discrete Time Signal

Ex: Cricket Score

Ex: Sinusoidal wave

- Continuous Time Signal (CTS)

* Information can be obtained at every instant of time.

* All information is available.

- Discrete Time Signal (DTS)

* Information at integer values can only be obtained

* All information will not be available

b. Deterministic Signal or Random Signal

- Deterministic Signal: The signal can be represented in a mathematical form is called a deterministic signal.

Ex: Sinusoidal signal: $x(t) = k + A \sin(\omega t + \phi)$

- Random Signal: since the signal has random information it cannot be represented in a mathematical form.

Ex: Runs scored in a cricket match.

NOTE:

Sampled CTS is DTS and sampled DTS is digital signal.

c. Even Signal or Odd Signal

$x(t)$	CTS	DTS
even	$x(-t) = x(t)$	$x(-n) = x(n)$
odd	$x(-t) = -x(t)$	$x(-n) = -x(n)$

Ex: $x(t) = \sin \omega t$ $x(t) = \cos \omega t$
 $x(-t) = \sin(-\omega t)$ $x(-t) = \cos(-\omega t)$
 $x(-t) = -\sin \omega t$ $x(-t) = \cos \omega t$
 $x(-t) = -x(t)$ $x(-t) = x(t)$

: It is an odd signal : It is an even signal.

Actual signal can be represented as sum of odd and even signal:

$$\text{CTS: } x(t) = x_e(t) + x_o(t) \quad \text{--- (1)}$$

$$\text{DTS: } x(n) = x_e(n) + x_o(n) \quad \text{--- (2)}$$

at $t = -t$

$$\text{From eq (1)} \quad x(-t) = x_e(-t) + x_o(-t)$$

$$x(-t) = x_e(t) - x_o(t) \quad \text{--- (3)}$$

$$\text{From eq (2)} \quad x(-n) = x_e(-n) + x_o(-n)$$

$$x(-n) = x_e(n) - x_o(n) \quad \text{--- (4)}$$

Adding eq (1) and (3)

$$x_e(t) = \frac{x(t) + x(-t)}{2}$$

subtracting eq ① and ③

$$x_o(t) = \frac{x(t) - x(-t)}{2}$$

similarly

$$x_e(n) = \frac{x(n) + x(-n)}{2}$$

$$x_o(n) = \frac{x(n) - x(-n)}{2}$$

NOTE: Even/Odd signal helps to find the symmetry of any signal
→ Even signals are symmetric about the vertical axis
Odd signals are antisymmetric about the vertical axis

→ CTS: $x(t)|_{t=0} = 0$ and DTS: $x(n)|_{n=0} = 0$
→ A signal can be neither odd nor even signal.

Q: check whether the following signals are odd or even:

1. $x(t) = 10 \sin \omega t$

$$x(-t) = 10 \sin(-\omega t) = -10 \sin \omega t$$

$\therefore x(-t) = -x(t) \Rightarrow$ it is an odd signal.

2. $x(t) = A \cos(t)$

$$x(-t) = A \cos(-t) = A \cos t$$

$\therefore x(-t) = x(t) \Rightarrow$ it is an even signal.

3. $x(n) = n + n^3 + 5n^5$

$$x(-n) = (-n) + (-n)^3 + 5(-n)^5 = -n - n^3 - 5n^5 = -(n + n^3 + 5n^5)$$

$\therefore x(-n) = -x(n) \Rightarrow$ it is an odd signal.

1. $x(n) = n^2 + 3n + 1$

$$x(-n) = (-n)^2 + 3(-n) + 1 = n^2 - 3n + 1$$

$\therefore x(-n) = x(n) \Rightarrow$ It is an even signal.

2. $x(t) = 10 + t + 2t^2$

$$x(-t) = 10 + (-t) + 2(-t)^2 = 10 - t + 2t^2$$

\therefore It is neither even nor odd.

3. $x(t) = e^{jt}$

$$x(-t) = e^{-jt} \therefore$$
 It is neither even nor odd.

Q: Find the amount of even and odd part available in the signal:

1. $x(t) = \cos(t) + \sin(t) + \cos(t)\sin(t)$

$$\begin{aligned} x(-t) &= \cos(-t) + \sin(-t) + \cos(-t)\sin(-t) \\ &= \cos t - \sin t - \cos t \sin t \end{aligned}$$

Odd part of the function is

$$x_o(t) = \frac{x(t) - x(-t)}{2}$$

$$x_o(t) = \frac{\cos t + \sin t + \cos t \sin t - \cos t - \sin t + \cos t \sin t}{2}$$

$$x_o(t) = \frac{2(\sin t + \cos t \sin t)}{2} = \frac{\sin t(1 + \cos t)}{1}$$

Even part of the function is

$$x_e(t) = \frac{x(t) + x(-t)}{2}$$

$$x_e(t) = \frac{\cos t + \sin t + \cos t \sin t + \cos t - \sin t - \cos t \sin t}{2}$$

$$x_e(t) = \frac{2\cos t}{2} = \frac{\cos t}{1}$$

$$2. \quad x(t) = [1+t^3] \cos^3 t$$

$$x(-t) = [1+(-t)^3] [\cos(-t)]^3$$

$$= [1-t^3] \cos^3 t$$

Even part of the signal is

$$x_e(t) = \frac{x(t) + x(-t)}{2}$$

$$x_e(t) = \underline{[1+t^3]} \cos^3 t + \underline{[1-t^3]} \cos^3 t$$

$$x_e(t) = \frac{\cos^3 t + t^3 \cos^3 t + \cos^3 t - t^3 \cos^3 t}{2}$$

$$x_e(t) = \frac{2 \cos^3 t}{2} = \underline{\underline{\cos^3 t}}$$

Odd part of the signal is

$$x_o(t) = [1+t^3] \cos^3 t - \cos^3 t \quad (\text{i.e., } x(t) - x_e(t))$$

$$x_o(t) = \cos^3 t + t^3 \cos^3 t - \cos^3 t$$

$$\underline{\underline{t^3 \cos^3 t}}$$

Q: Show that the product of two even signals results into an even signal.

~~E.g.~~ let the two ^{even} signals be

$$x_1(t) = \cos wt$$

$$y(t) = t^2$$

$$x_1(t)y(t) = t^2 \cos wt$$

$$\text{at } t = -t$$

$$x_1(-t)y(-t) = (-t)^2 \cos(-wt)$$

$$x_1(-t)y(-t) = t^2 \cos wt$$

$$\text{Since } x_1(t)y(t) = x_1(-t)y(-t)$$

\therefore It is an even signal.

∴ Product of two even signals results into even signal.

Let $x_1(t)$ and $x_2(t)$ are two even signals.

Let the resulting signal be $x(t)$

$$\therefore x(t) = x_1(t)x_2(t)$$

$$\text{at } t = -t$$

$$x(-t) = x_1(-t)x_2(-t)$$

since x_1 and x_2 are even

$$x_1(t) = x_1(-t)$$

$$x_2(t) = x_2(-t)$$

$$\therefore x(-t) = x_1(t)x_2(t)$$

Hence $x(t)$ is an even signal.
($x(t)$)

Q: show that the product of two odd signals result into an even signal.

let $x_1(t)$ and $x_2(t)$ be two odd signals

let the resulting signal be $x(t)$

$$\therefore x(t) = x_1(t)x_2(t)$$

$$\text{at } t = -t$$

$$x(-t) = x_1(-t)x_2(-t)$$

Since x_1 and x_2 are odd

$$x_1(-t) = -x_1(t)$$

$$x_2(-t) = -x_2(t)$$

$$\therefore x(-t) = [-x_1(t)][-x_2(t)] = x_1(t)x_2(t)$$

∴ The resulting signal is an even signal.

Q: Show that the product of an odd signal and an even signal results into an odd signal.

Let $x_1(t)$ be odd signal and $x_2(t)$ be even signal.

Let the resulting signal be $x(t)$

$$\therefore x(t) = x_1(t)x_2(t)$$

$$\text{at } t = -t$$

$$x(-t) = x_1(-t)x_2(t)$$

Since x_1 is odd and x_2 is even

$$x_1(-t) = -x_1(t)$$

$$x_2(-t) = x_2(t)$$

$$\therefore x(-t) = -x_1(t)x_2(t)$$

∴ The resulting signal is an odd signal.

d. Periodic Signal or Aperiodic Signal

Periodic signal: The signal repeats after its fundamental time period.

Aperiodic signal: Any signal that does not repeat after any its fundamental time period.

~~fundamental~~ → (random signal)

Periodic signal

$$\text{CTS} \quad x(t) = k + A \sin(\omega t + \phi) \text{ sine signal} \quad \omega = 2\pi f = \frac{2\pi}{T}$$

$$x(t) = k + A \cos(\omega t + \phi) \text{ cosine signal}$$

$$x(t) = k + A e^{j\omega t + \phi} \text{ complex signal}$$

CTS signal

$$\text{DTS} \quad x(n) = k + A \sin(\Omega n + \phi)$$

$$x(n) = k + A \cos(\Omega n + \phi)$$

DTS signal

$$\Omega = 2\pi \frac{m}{N}$$

NOTE:

- Two signals (periodic) with same frequency are additive in nature and the result is also periodic.
- Two ~~not~~ same signals with different frequency then $\frac{T_1}{T_2}$ if rational then $T = \text{LCM}(T_1, T_2)$

Ex: $T_1 = 5$ and $T_2 = 10$

$$\frac{T_1}{T_2} = \frac{5}{10} = 0.5 \text{ it is rational}$$

$\therefore T = \text{LCM}(T_1, T_2) = 10$ hence is periodic.

Ex: $T_1 = 2\pi/3$ and $T_2 = 2\pi/7$

$$T = \frac{\text{LCM}(2\pi, 2\pi)}{\text{HCF}(3, 7)} = \frac{2\pi}{21}$$

Q: check whether the following signals are periodic or aperiodic.
if periodic find its fundamental time period.

1. $x(t) = 10 \cos(3t + \pi/4)$

$$\omega = 3 \Rightarrow \frac{2\pi}{T} = 3$$

$x(t)$ is periodic signal
with $T = 2\pi/3$ sec.

$$\therefore T = \underline{\underline{2\pi/3}}$$

2. $x(t) = \cos^2(4\pi t)$

$$x(t) = \frac{1}{2} + \frac{1}{2} \cos(8\pi t)$$

$$\omega = 8\pi \Rightarrow \frac{2\pi}{T} = 8\pi$$

$x(t)$ is periodic signal
with $T = 1/4$ sec.

$$\therefore T = \underline{\underline{1/4}} //$$

3. $x(t) = \cos(\pi t/3) + \sin(\pi t/4)$

$$\omega_1 = \frac{\pi}{3} \Rightarrow \frac{2\pi}{T_1} = \frac{\pi}{3} \therefore T_1 = 6$$

$$\omega_2 = \frac{\pi}{4} \Rightarrow \frac{2\pi}{T_2} = \frac{\pi}{4} \therefore T_2 = 8 \quad \therefore x(t) \text{ is periodic signal with } T = 24 \text{ sec.}$$

$$T_p = \text{LCM}(T_1, T_2) = \text{LCM}(6, 8)$$

$$\underline{\underline{T = 24}}$$

4. $x(n) = \min\left(\frac{\pi n}{4}\right)$

$$\Omega = \frac{\pi}{4} = 2\pi \left(\frac{1}{8}\right)$$

$$2\pi \left(\frac{n}{N}\right) = 2\pi \left(\frac{1}{8}\right) \quad N = \underline{\underline{8 \text{ samples}}}$$

$\frac{1}{8}$ is rational

\therefore the signal is periodic

5. $x(n) = \sin^2\left(\frac{\pi n}{4}\right)$

$$x(n) = \frac{1}{2} + \frac{1}{2} \cos\left(\frac{\pi n}{2}\right)$$

$$\Omega = \frac{\pi}{2} = 2\pi\left(\frac{1}{4}\right)$$

since $\frac{n}{N} = \frac{1}{4}$ is rational

$$2\pi\left(\frac{m}{N}\right) = 2\pi\left(\frac{1}{4}\right)$$

It is periodic signal.

$\therefore N = 4$ samples

6. $x(n) = \cos\left(\frac{\pi n}{3}\right) + \sin\left(\frac{\pi n}{5}\right)$

$$\Omega_1 = \frac{\pi}{3} = 2\pi\left(\frac{1}{6}\right) \quad \Omega_2 = \frac{\pi}{5} = 2\pi\left(\frac{1}{10}\right)$$

$$2\pi\left(\frac{m}{N_1}\right) = 2\pi\left(\frac{1}{6}\right)$$

$$2\pi\left(\frac{m}{N_2}\right) = 2\pi\left(\frac{1}{10}\right)$$

$N_1 = 6$ samples

$N_2 = 10$ samples

$$N = \frac{N_1}{N_2} = \frac{6}{10} = 0.6 \quad ! \text{ rational}$$

Hence it is periodic signal.

$$N = \text{LCM}(N_1, N_2)$$

$$N = \text{LCM}(6, 10) = 30 \text{ samples}$$

7. $x(n) = \pi + \cos(2n)$

$$\Omega = 2 = 2\pi\left(\frac{1}{\pi}\right)$$

$$2\pi\left(\frac{m}{N}\right) = 2\pi\left(\frac{1}{\pi}\right) \Rightarrow \therefore \text{it is irrational}$$

Hence not a periodic signal.

$$8. \quad x(n) = 15 \cos(0.2\pi n)$$

$$\omega = 0.2\pi = 2\pi \left(\frac{1}{10}\right)$$

$$\therefore 2\pi \left(\frac{1}{10}\right) = 2\pi \left(\frac{m}{N}\right) \quad \therefore x(n) \text{ is a periodic signal}$$

$N = 10 \text{ samples}$

$$9. \quad x(t) = \cos t + \sin(\sqrt{2}t)$$

$$\omega_1 = 1 \Rightarrow \frac{2\pi}{T_1} = 1$$

$$\therefore T_1 = \underline{\underline{2\pi}}$$

$\therefore x(t)$ is an aperiodic signal

$$\omega_2 = \sqrt{2} \Rightarrow \frac{2\pi}{T_2} = \sqrt{2}$$

$$\therefore T_2 = \underline{\underline{\sqrt{2}\pi}} \quad \frac{T_1}{T_2} = \frac{2\pi}{\sqrt{2}\pi} = \sqrt{2} \quad \text{It is irrational}$$

$$10. \quad x(n) = \operatorname{Re} [e^{jnx_1}] + jx_2 [e^{jnx_2}]$$

$$x(n) = \cos \frac{n\pi}{4} + j \sin \frac{n\pi}{3}$$

$$\omega_1 = \frac{\pi}{4} \Rightarrow \frac{2\pi}{T_1} = \frac{\pi}{4}$$

$$\omega_1 = \frac{\pi}{4} = 2\pi \left(\frac{1}{8}\right)$$

$$\therefore T_1 = \underline{\underline{8}}$$

$$\therefore 2\pi \left(\frac{m}{N_1}\right) = 2\pi \left(\frac{1}{8}\right)$$

$$\omega_2 = \frac{\pi}{3} \Rightarrow \frac{2\pi}{T_2} = \frac{\pi}{3}$$

$$\therefore N_1 = \underline{\underline{8 \text{ samples}}}$$

$$\therefore T_2 = \underline{\underline{6}}$$

$$\omega_2 = \frac{\pi}{3} = 2\pi \left(\frac{1}{6}\right)$$

$$\frac{T_1}{T_2} = \frac{8}{6} \quad \text{It is rational}$$

$$\therefore 2\pi \left(\frac{m}{N_2}\right) = 2\pi \left(\frac{1}{6}\right)$$

$$T = \operatorname{LCM}(T_1, T_2)$$

$$\therefore N_2 = \underline{\underline{6 \text{ samples}}}$$

$$\underline{\underline{T = 24}}$$

$$\frac{N_1}{N_2} = \frac{8}{6} \quad \text{is rational hence periodic}$$

$$N = \operatorname{LCM}(N_1, N_2) = \operatorname{LCM}(8, 6) = \underline{\underline{24 \text{ samples}}}$$

$$\begin{aligned}
 \text{II. } x(n) &= \cos\left(\frac{\pi n}{5}\right) \sin\left(\frac{\pi n}{3}\right) \\
 &= \frac{1}{2} \left[\sin\left(\frac{\pi n}{5} + \frac{\pi n}{3}\right) - \sin\left(\frac{\pi n}{5} - \frac{\pi n}{3}\right) \right] \\
 &= \frac{1}{2} \left(\sin\left(\frac{8\pi n}{15}\right) + \sin\left(\frac{2\pi n}{15}\right) \right) \\
 \Omega_1 &= \frac{8\pi}{15} = 2\pi\left(\frac{4}{15}\right) \\
 \therefore 2\pi\left(\frac{m}{N_1}\right) &= 2\pi\left(\frac{4}{15}\right) \quad \therefore N_1 = 15 \text{ samples}
 \end{aligned}$$

$$\begin{aligned}
 \Omega_2 &= \frac{2\pi}{15} = 2\pi\left(\frac{1}{15}\right) \\
 \therefore 2\pi\left(\frac{m}{N_2}\right) &= 2\pi\left(\frac{1}{15}\right) \quad \therefore N_2 = 15 \text{ samples}
 \end{aligned}$$

$$\begin{aligned}
 \frac{N_1}{N_2} &= \frac{15}{15} = 1 \text{ is rational} \\
 &\therefore x(n) \text{ is periodic signal}
 \end{aligned}$$

$$\therefore N = \text{LCM}(N_1, N_2)$$

$$N = \text{LCM}(15, 15) = 15 \text{ samples}$$

* Basic Elementary Signals:

1. Unit Impulse Signal: It is a signal whose area is equal to 1 and information is available only at $t=0$.

It is denoted by $\delta(t)$

$$\text{LTS: } \delta(t) = \begin{cases} 1 & \text{at } t=0 \\ 0 & \text{Else} \end{cases}$$

$$\text{DTS: } \delta(n) = \begin{cases} 1 & \text{at } n=0 \\ 0 & \text{Else} \end{cases}$$

2. Unit Step Signal:

It is denoted by $u(t)$

$$\text{LTS: } u(t) = \begin{cases} 1 & t \geq 0 \\ 0 & \text{Else} \end{cases}$$

$$u(t) = \int_0^t \delta(t) dt$$

$$\text{DTS: } u(n) = \begin{cases} 1 & ; n \geq 0 \\ 0 & ; \text{Else} \end{cases}$$

$$u(n) = \sum_{k=0}^{\infty} \delta(n-k)$$

3. Ramp Signal:

It is denoted by $r(t)$

$$\text{CTS: } r(t) = \begin{cases} t & t \geq 0 \\ 0 & \text{Else} \end{cases}$$

$$\frac{d}{dt} [r(t)] = u(t)$$

$$\text{DTS: } r(n) = \begin{cases} n & n \geq 0 \\ 0 & \text{Else} \end{cases}$$

4. Pulse Signal:

Rectangular Pulse

CTS:

$$\text{rect}(t) = \begin{cases} 1 & ; -0.5 \leq t \leq 0.5 \\ 0 & ; \text{Else} \end{cases}$$

Triangular Pulse

CTS:

$$\text{tri}(t) = \begin{cases} t+1 & ; -1 \leq t \leq 0 \\ -t+1 & ; 0 \leq t \leq 1 \\ 0 & ; \text{else} \end{cases}$$

$$\text{DTS: } \text{rect}(n) = \begin{cases} 1 & ; -N \leq n \leq N \\ 0 & ; \text{Else} \end{cases}$$

$$\text{DTS: } \text{Tri}(n) = \begin{cases} 1 - |n|/N & ; |n| \leq N \\ 0 & ; \text{Else} \end{cases}$$

* Basic Operations on Signals:

- Operation on dependent variable: ($x(t)$ / $x(n)$)

1. Time scaling
2. Addition
3. Multiplication
4. Integration
5. Differentiation

- Operation on Independent variable: (t/n)

1. Time Shift
2. Time Reflection
3. Time Scaling

* Time Scaling:

$$y(t) = a x(t)$$

$a > 1$: amplification

$$y(n) = a x(n)$$

$a < 1$: attenuation.

Here a is the scaling factor.

A physical example of a device that performs amplitude scaling is an electronic amplifier or an electronic attenuator which depends on the value of a .

* Addition:

$$y(t) = x_1(t) + x_2(t)$$

$$y(n) = x_1(n) + x_2(n)$$

A physical example of a device that adds signals is an audio mixer, which combines music and voice signals.

Addition of signals is the addition of their corresponding amplitudes.

$$\hookrightarrow y(t) = x_1(t) + x_2(t)$$

(CTS)

$$y(n) = x_1(n) + x_2(n)$$

(DTS)

* Multiplication:

$$y(t) = x_1(t) \times x_2(t)$$

$$y(n) = x_1(n) * x_2(n)$$

$$\therefore y(t) = x_1(t) \cdot x_2(t)$$

NOTE:

Here multiplication of ramp with a ramp gives zero signal. But multiplication of any two signal we expect an output. In such condition we have to consider the intermediate points.

* Integration

$$y(t) = \int_{-\infty}^t x(\tau) d\tau$$

Integration is fundamental in signal processing operations such as the Fourier transform, correlation and convolution. It is used to analyse different properties of a signal.

$$\int_0^\infty \delta(t) dt = u(t)$$

$$\int_0^\infty u(t) dt = r(t)$$

* Differentiation

$$y(t) = \frac{d}{dt} x(t)$$

A signal is differentiated to determine the rate at which it changes.

It is applicable for both continuous time signals and discrete time signals.

$$\frac{d}{dt} u(t) = \delta(t)$$

$$\frac{d}{dt} r(t) = u(t)$$

* Time Shift:

$$y(t) = x(t-k) \quad (\text{right shift by } k \text{ units})$$

$$y(t) = x(t+k) \quad (\text{left shift by } k \text{ units})$$

$$y(n) = x(n-k) \quad (\text{right shift by } k \text{ units})$$

$$y(n) = x(n+k) \quad (\text{left shift by } k \text{ units})$$

CTS

k - denotes the time shift.

The value of k determines towards which side the signal is shifted and by how many units.

* Time Reflection:

$$y(t) = x(t-t)$$

$$y(n) = x(-n)$$

* Time Scaling:

$$y(at) = x(t)$$

$$y(n) = x(an)$$

$a < 1$: Expansion

$a > 1$: compression

$$y(t) = x(2t)$$

$$y(t) = x(t/2)$$

The signal is obtained by scaling the independent variable by a factor a .

If $a > 1$, then the obtained signal is a compressed version.

If $a < 1$, then the obtained signal is an expanded version.

In DTS signal, on time scaling there is loss in information for non integer values.

NOTE:

- Priority:
1. Time shift
 2. Time reflection
 3. Time scaling

Ex: For $x(-2t+2)$

1. $x(t+2)$ time shift
2. $x(-t+2)$ time reflection
3. $x(-2t+2)$ time scaling

It is very necessary to perform the operation of shifting, time reflection and time scaling in the right order to obtain the output correctly.

Q1: $x(-2t+2)$

Q2: $y(t) = u(t) - u(t-2)$

Q4: $y(t) = r(t+1) - r(t) + r(t-2)$

Q3: $y(t) = \text{Rect}(t) + \text{Rect}(t/2) + \text{Rect}(t/3)$

Q: For the given signal $x(t)$ sketch the following:
 Q2. $y(t) = x(t) + x(2-t)$

$$Q.2. \quad y(t) = [x(t) + x(2-t)] u(1-t)$$

Q3: $y(t) = [\delta(t + 3/2) - \delta(t - 3/2)]x(t)$

Q: For a given signal $x(t)$ sketch the following

1. $x(t+2)$

2. $x(t-2)$

3. $3x(t/2)$

4. $1/2x(-t/2)$

5. $x(2t+1)$

6. $x(2-3t)$

1. $x(t+2)$ 4. $\frac{1}{2}x(-t/2)$ 2. $x(t-2)$ 5. $x(2t+1)$ 3. $3x(t/2)$ 6. $x(2-3t)$ 

4.

Q: For a given signal $x(n)$ sketch the following.

6. $x(n)$

1. $x(n-2)$

4. $\frac{1}{2}x(-n/2)$

5. $x(2n+1)$

2. $x(n+2)$

$x(n+1)$

$x(2n+1)$

3. $3x(n/2)$ $3x(n/2)$

b. $x(2-3n)$

Q: sketch the signal and its derivative for the following:

$$1. x_1(t) = u(t) - u(t-a)$$

$$\frac{d}{dt}x_1(t) = \delta(t) - \delta(t-a)$$

$$2. x_2(t) = t[u(t) - u(t-a)]$$

Q 3:

→ System:

H or T : operator.

Output is obtained by performing operation on the input.

$$\text{CTS: } y(t) = H\{x(t)\}$$

$$\text{DTS: } y(n) = H\{x(n)\}$$

For Continuous time system given a CTS as input the output will be CTS similarly for Discrete Time System or Digital system given a DTS as input the output will be DTS.

A digital system usually consists of an adder, a multiplier and delay elements.

In order to get a delay of k units we can have k number of delay elements.

This can be done by different types of connections.

1. Cascade connection

(end to end connection of subsystems)

2. Parallel connection

(common input terminal for all subsystems)

- * Properties of system:
 - linearity: Any system which obeys superposition is linear in nature.
- 1. A system is said to be linear when

$$a_1x_1(n) + b_2x_2(n) = a_1y_1(n) + b_2y_2(n)$$

$$x_3(n) = y_3(n)$$
 Any modification in input should lead to same modification in the output.

- 2. - Time Invariant: If there is any delay in the input then the same delay is expected at the output. That is there should be same time shifting even after any processing of input.

NOTE:

$$\text{let } y(n) = \sin 6n + x(n)$$

$$\text{change in input } x(n) - x(n-k); y(n) - \sin 6n + x(n-k)$$

$$\text{change in output } y(n) - y(n-k); y(n-k) = \sin 6(n-k) + x(n-k)$$

- 3. - Causal: Real time signal: present and past
noncausal: future.

- 4. - Memory: When the output is dependent on past or future or both then it is called memory system.

It can be dynamic and static.

Non-memory system or memoryless system where the output depends on past or future.

- 5. - Stable: BIBO: Bounded Input Bounded Output.
i.e., a finite input gives a finite output.

$$\text{Ex: } y(n) = \frac{1}{n}; \quad n=0 \quad y(n) = \infty$$

input: finite output: infinite

Hence not stable

- Invertible:

$$y(t) = H\{x(t)\}$$

$$f(t) = H^{-1}\{y(t)\}$$

$$= H^{-1}\{H\{x(t)\}\}$$

$$\underline{f(t) = x(t)}$$

Q: check whether the following systems are, linear, time invariant, causal, memory and stable.

i. $y(t) = x(t/2)$

Sol: Linear: Here $y_1(t) = x_1(t/2)$

$$y_2(t) = x_2(t/2)$$

$$y_3(t) = x_3(t/2)$$

$$\text{Let } x_2(t) = ax_1(t) + bx_2(t)$$

$$y_3(t) = ax_1(t/2) + bx_2(t/2) \quad (\because y_3(t) = x_3(t/2))$$

$$\therefore y_3(t) = a y_1(t) + b y_2(t)$$

$$\text{Hence } y_3(t) = x_3(t)$$

Therefore the system is linear.

Time invariant

Change in input: $x(t) \rightarrow x(t-t_0)$; $y(t) = x(t/2 - t_0)$

Change in output: $y(t) \rightarrow y(t-t_0)$; $y(t) = x(t-t_0)$

Therefore the system is time variant

Causal

$t = -1 \quad y(-1) = x(-1/2)$: future

$t = 0 \quad y(0) = x(0)$: present

$t = +1 \quad y(1) = x(1/2)$: past

Therefore the system is non causal.

Memory

$$t = -1$$

$$y(-1) = x(-\frac{1}{2}) : \text{future}$$

$$t = 0$$

$$y(0) = x(0) : \text{present}$$

$$t = 1$$

$$y(1) = x(\frac{1}{2}) : \text{past}$$

∴ therefore the system is a memory system.

Stability

$$x(t) \leq M_x < \infty$$

$$y(t) \leq M_y < \infty$$

∴ therefore it is a stable system.

2. $y(t) = \sin 6t + x(t)$

sd: linear $y_1(t) = \sin 6t + x_1(t)$

$$y_2(t) = \sin 6t + x_2(t)$$

$$y_3(t) = \sin 6t + x_3(t)$$

$$\text{let } x_3(t) = a x_1(t) + b x_2(t)$$

$$y_3(t) = a y_1(t) + b y_2(t) + \sin 6t$$

$$\therefore y_3(t) \neq a y_1(t) + b y_2(t)$$

Hence it is a nonlinear system.

Time invariant

$$\text{Change in input } x(t) \rightarrow x(t-t_0); y(t) = \sin 6t + x(t-t_0)$$

$$\text{Change in output } y(t) \rightarrow y(t-t_0); y(t) = \sin 6(t-t_0) + x(t-t_0)$$

Hence it is a time variant system.

Causal

$$t = -1 \quad y(-1) = \sin 6t + x(-1) : \text{Present}$$

$$t = 0 \quad y(0) = \sin 6t + x(0) : \text{Present}$$

$$t = 1 \quad y(1) = \sin 6t + x(1) : \text{Present}$$

Therefore it is a causal system.

Memory

$$t = -1 \quad y(-1) = \sin 6t + x(-1) : \text{Present}$$

$$t = 0 \quad y(0) = \sin 6t + x(0) : \text{Present}$$

$$t = 1 \quad y(1) = \sin 6t + x(1) : \text{Present}$$

Therefore the system is a memory less system.

stability

$$x(t) \leq M_x < \infty$$

$$y(t) \leq M_y < \infty$$

Therefore it is a stable system.

3. $y(t) = \sqrt{x(t)}$

sol: Linearity

$$y_1(t) = \sqrt{x_1(t)}$$

$$y_2(t) = \sqrt{x_2(t)}$$

$$y_3(t) = \sqrt{x_3(t)}$$

$$\text{let } x_3(t) = a x_1(t) + b x_2(t)$$

$$y_3(t) = \sqrt{a x_1(t) + b x_2(t)}$$

$$\therefore y_3(t) \neq a y_1(t) + b y_2(t)$$

Hence it is a non linear system.

Time invariant

$$\text{Change in input } x(t) \rightarrow x(t-t_0); y(t) = \sqrt{x(t-t_0)}$$

$$\text{change in output } y(t) \rightarrow y(t-t_0); y(t) = \sqrt{x(t-t_0)}$$

Therefore it is a time invariant system.

Causal

$$t = -1 \quad y(-1) = \sqrt{x(-1)} : \text{Present}$$

$$t = 0 \quad y(0) = \sqrt{x(0)} : \text{Present}$$

$$t = +1 \quad y(1) = \sqrt{x(1)} : \text{Present}$$

Therefore it is a causal system.

Memory

$$t = -1 \quad y(-1) = \sqrt{x(-1)} : \text{Present}$$

$$t = 0 \quad y(0) = \sqrt{x(0)} : \text{Present}$$

$$t = 1 \quad y(1) = \sqrt{x(1)} : \text{Present}$$

Therefore it is a memoryless system. (static memory)

Stability

$$x(t) \leq M_x < \infty$$

$$y(t) \leq M_y < \infty$$

Therefore it is a stable system.

$$\uparrow \quad y(n) = n x(n+2)$$

Sol: Linearity

$$y_1(n) = n x_1(n+2)$$

$$y_2(n) = n x_2(n+2)$$

$$y_3(n) = n x_3(n+2)$$

$$\text{Let } x_2(n) = a x_1(n) + b x_2(n)$$

$$y_3(n) = n [a x_1(n+2) + b x_2(n+2)] \\ = n a x_1(n+2) + n b x_2(n+2)$$

$$y_3(n) = a y_1(n) + b y_2(n)$$

Therefore it is a linear system

Time invariant

change in input $x(n) \rightarrow x(n-t-n_0)$; $y(n) = n x_1(n+2-n_0)$

change in output $y(n) \rightarrow y(n-n_0)$; $y(n) = (n-n_0) x_1(n-n_0+2)$

Therefore it is a time invariant system.

Causal

$n=-1 \quad y(-1) = n x(1)$: future

$n=0 \quad y(0) = n x(2)$: future

$n=1 \quad y(1) = n x(3)$: future

Therefore it is a causal system.

Memory

$n=-1 \quad y(-1) = n x(1)$: future

$n=0 \quad y(0) = n x(2)$: future

$n=1 \quad y(1) = n x(3)$: future

Therefore it is a memory system (dynamic memory)

$$x(n) \leq M_x < \infty$$

$$y(n) \leq M_y < \infty$$

It does not obey BIBO hence It is an unstable system

$$5. \quad y(n) = \sum_{k=-\infty}^n x(k+2)$$

Sol: Linearity

$$y_1(n) = \sum_{k=-\infty}^n x_1(k+2)$$

$$y_2(n) = \sum_{k=-\infty}^n x_2(k+2)$$

$$y_3(n) = \sum_{k=-\infty}^n x_3(k+2)$$

$$\text{Let } x_3(n) = ax_1(n) + bx_2(n)$$

$$y_3(n) = \sum_{k=-\infty}^n [ax_1(k+2) + bx_2(k+2)]$$

$$y_3(n) = a \sum_{k=-\infty}^n x_1(k+2) + b \sum_{k=-\infty}^n x_2(k+2)$$

$$y_3(n) = ay_1(n) + by_2(n)$$

Therefore it is a linear system

Time invariant

$$\text{change in input } x(n) \rightarrow x(n-n_0); \quad y(n) = \sum_{k=-\infty}^n x_k(k+2-n_0)$$

$$\text{Change in output } y(n) \rightarrow y(n-n_0); \quad y(n) = \sum_{k=-\infty}^{n-n_0} x(k+2)$$

Therefore the system is time variant system.

Causal

$$n = -k \quad y(-k) = \sum_{k=-\infty}^{-k} x(k+2) : \text{future}$$

.....

$$n = 0 \quad y(0) = \sum_{k=-\infty}^0 x(k+2) : \text{future}$$

$$n = k \quad y(k) = \sum_{k=-\infty}^k x(k+2) : \text{future}$$

Therefore the system is noncausal system

Memory

$$n = -k \quad y(-k) = \sum_{k=-\infty}^{\infty} x(k+2) : \text{future}$$

$$n = 0 \quad y(0) = \sum_{k=-\infty}^{\infty} x(k+2) : \text{future}$$

$$n = k \quad y(k) = \sum_{k=-\infty}^{k} x(k+2) : \text{future}$$

Therefore it is a memory system.

Stability

$$x(t) \leq M_x < \infty$$

$$y(t) \leq M_y < \infty$$

Therefore it is a stable system.

* Energy and Power Signal:

TIME - DOMAIN REPRESENTATION FOR LTI SYSTEMS

* Frequency domain:

Spectral Analysis : ECG

It gives more information when compared to time domain.

* Time domain:

LTI systems: linear time invariant systems.

$$1. \quad x(n) = \delta(n)$$

$$x(t) = \delta(t)$$

$$2. \quad x(n) = u(n)$$

$$x(t) = u(t)$$

$$y(t) = \text{Impulse response} = h(t)$$

$$y(n) = \text{Step response}$$

$$y(t) = \text{Step response}$$

* Convolution Sum:

The response of a system when the input is an impulse function, is defined as the impulse response or unit sample response of the system.

$$x(n) = \{1, 2, -1, 0.5, 1, 2\}$$

$$x(n) = 1\delta(n+2) + 2\delta(n+1) + (-1)\delta(n) + 0.5\delta(n-1) + 1\delta(n-2) + 2\delta(n-3)$$

$$x(n) = x(+2)\delta(n+2) + x(-1)\delta(n+1) + x(0)\delta(n) + x(1)\delta(n-1) + x(2)\delta(n-2) + x(3)\delta(n-3)$$

$$\therefore x(n) = \sum_{k=-2}^3 x(k) \delta(n-k)$$

In general

$$x(n) = \sum_{k=-\infty}^{\infty} x(k) \delta(n-k)$$

Let $x(n)$ be input and $y(n)$ be output for LTI system.

$$y(n) = T\{x(n)\}$$

$$y(n) = T\left\{ \sum_{k=-\infty}^{\infty} x(k) \delta(n-k) \right\}$$

knowing past and present we can predict the future, this one of the application of convolution.

$$y(n) = \sum_{k=-\infty}^{\infty} x(k) T\{\delta(n-k)\}$$

$$y(n) = \sum_{k=-\infty}^{\infty} x(k) h(n-k)$$

$$y(n) = x(n) * h(n)$$

* Properties of convolution sum:

1. commutative

$$x(n) * h(n) = h(n) * x(n)$$

2. Distributive

$$x(n) * [h_1(n) + h_2(n)] = x(n) * h_1(n) + x(n) * h_2(n)$$

3. Associative

$$x(n) * [h_1(n) * h_2(n)] = [x(n) * h_1(n)] * h_2(n)$$

PROOF:

1. Commutative

considering LHS

$$x(n) * h(n) = \sum_{k=-\infty}^{\infty} x(k) h(n-k)$$

- Let $n-k=r \Rightarrow k=n-r$

$$\therefore x(n) * h(n) = \sum_{r=-\infty}^{\infty} x(n-r) h(r)$$

$$= \sum_{r=-\infty}^{\infty} h(r) x(n-r)$$

since τ is just any variable

$$\therefore x(n) * h(n) = \sum_{k=-\infty}^{\infty} h(k) x(n-k)$$

$$x(n) * h(n) = h(n) * x(n)$$

2. Distributive

considering LHS

$$\begin{aligned} x(n) * [h_1(n) + h_2(n)] &= \sum_{k=-\infty}^{\infty} x(k) [h_1(n-k) + h_2(n-k)] \\ &= \sum_{k=-\infty}^{\infty} x(k) h_1(n-k) + \sum_{k=-\infty}^{\infty} x(k) h_2(n-k) \end{aligned}$$

$$x(n) * [h_1(n) + h_2(n)] = x(n) * h_1(n) + x(n) * h_2(n)$$

3. Associative

considering RHS

$$\begin{aligned} [x(n) * h_1(n)] * h_2(n) &= \sum_{k=-\infty}^{\infty} [x(k) * h_1(k)] h_2(n-k) \\ &= \sum_{k=-\infty}^{\infty} \left[\sum_{m=-\infty}^{\infty} x(m) h_1(k-m) \right] h_2(n-k) \end{aligned}$$

Changing the order of summation, we get

$$[x(n) * h_1(n)] * h_2(n) = \sum_{m=-\infty}^{\infty} x(m) \left[\sum_{k=-\infty}^{\infty} h_1(k-m) h_2(n-k) \right]$$

Let $\tau = k-m$

$$\begin{aligned} \therefore [x(n) * h_1(n)] * h_2(n) &= \sum_{m=-\infty}^{\infty} x(m) \left[\sum_{\tau=-\infty}^{\infty} h_1(\tau) h_2(n-m-\tau) \right] \\ &= \sum_{m=-\infty}^{\infty} x(m) [h_1(n-m) * h_2(n-m)] \\ &= \sum_{k=-\infty}^{\infty} x(k) [h_1(n-k) * h_2(n-k)] \end{aligned}$$

$$[x(n) * h_1(n)] * h_2(n) = x(n) * [h_1(n) * h_2(n)]$$

$$y(n) - \frac{1}{4}y(n-1) - \frac{1}{8}y(n-2) = 0$$

$$q^0 - \frac{1}{4}q^{-1} - \frac{1}{8}q^{-2} = 0$$

$$q^2 - \frac{1}{4}q - \frac{1}{8} = 0$$

$$\Rightarrow q_1 = \frac{1}{2} \text{ and } q_2 = -\frac{1}{4} //$$

$$\therefore y_p(n) = A_1 \left[\frac{1}{2} \right]^n + A_2 \left[-\frac{1}{4} \right]^n \quad \text{--- ②}$$

To find $y_p(n)$

$$x(n) = 2u(n)$$

$$x(n) = 2 \quad ; \quad n \geq 0$$

$$\therefore y_p(n) = k$$

Substituting in eq ①

$$k - \frac{1}{4}k - \frac{1}{8}k = 2 + 2$$

$$8k - 2k - k = 32$$

$$5k = 32$$

$$k = \frac{32}{5} //$$

$$\therefore y_p(n) = \frac{32}{5} //$$

$$y(n) = \frac{1}{4}y(n-1) + \frac{1}{8}y(n-2) + x(n) + x(n-1)$$

at $n=0$

$$y(0) = \frac{1}{4}y(-1) + \frac{1}{8}y(-2) + x(0) + x(-1)$$

$$y(0) = \cancel{-2} + \frac{1}{8}(1)$$

$$\underline{\underline{y(0) = 1/8}}$$

at $n=1$

$$y(1) = \frac{1}{4}y(0) + \frac{1}{8}y(-1) + x(1) + x(0)$$

$$y(1) = \frac{1}{4} \cdot \frac{17}{8} + \frac{1}{8}(0) + 2 + 2$$

$$\underline{\underline{y(1) = 145/32}}$$

To find A_1 and A_2

$$y_c(n) = y_n(n) + y_p(n)$$

$$y_c(n) = A_1 \left[\frac{1}{2} \right]^n + A_2 \left[-\frac{1}{4} \right]^n + \frac{32}{5}$$

at $n=0$

$$y(0) = A_1 \left(\frac{1}{2} \right)^0 + A_2 \left(-\frac{1}{4} \right)^0 + \frac{32}{5}$$

$$17/8 = A_1 + A_2 + 32/5$$

$$A_1 + A_2 = 321/40$$

at $n=1$

$$y(1) = A_1 \left(\frac{1}{2} \right)^1 + A_2 \left(-\frac{1}{4} \right)^1 + \frac{32}{5}$$

$$145/32 = A_1/2 - A_2/4 + 32/5$$

$$2A_1 - A_2 = -299/40$$

$$\therefore A_1 = -16/15 \quad A_2 = 641/120$$

$$\therefore y_c(n) = \left[\frac{-16}{15} \right] \left[\frac{1}{2} \right]^n + \left[\frac{641}{120} \right] \left[-\frac{1}{4} \right]^n + \frac{32}{5}$$

Z - TransformNOTE:

- Fourier Transform

continuous Time Signal Fourier Transform and Discrete Time Signal Fourier Transform is possible. only analysis of Energy or power signal can be done.

- Laplace Transform

Only applicable for continuous time signal. Here analysis of Energy, power or neither energy nor power is possible.

- Z - Transform

Applicable for discrete time signal and analysis of energy, power or neither energy nor power signal is possible.

$$w(k) = \frac{1}{N} \sum_{l=0}^{N-1} x(l) \sum_{n=0}^{N-1} y(n) e^{-j (k-l) \omega_0 n}$$

$$w(k) = \sum_{l=0}^{N-1} x(l) y(k-l)$$

$$w(k) = X(k) * Y(k)$$

6. Parseval's Theorem:

If $x(n)$ DTFS $\rightarrow x(k)$: $\omega_0 = 2\pi/N$
 then $\frac{1}{N} \sum_{n=0}^{N-1} |x(n)|^2 = \sum_{k=0}^{N-1} |x(k)|^2$

Proof: LHS of the equation is the average power of a periodic discrete-time signal with fundamental period N , i.e., $P = \frac{1}{N} \sum_{n=0}^{N-1} |x(n)|^2$

$$P = \frac{1}{N} \sum_{n=0}^{N-1} x(n) \cdot x^*(n) \quad \text{complex signal}$$

$$P = \frac{1}{N} \sum_{n=0}^{N-1} x(n) \left[\sum_{k=0}^{N-1} x^*(k) e^{-j k \omega_0 n} \right]$$

Changing the order of summation.

$$P = \sum_{k=0}^{N-1} x^*(k) \left[\frac{1}{N} \sum_{n=0}^{N-1} x(n) e^{-j k \omega_0 n} \right]$$

$$P = \sum_{k=0}^{N-1} |x(k)|^2$$

$$\text{Therefore } \frac{1}{N} \sum_{n=0}^{N-1} |x(n)|^2 = \sum_{k=0}^{N-1} |x(k)|^2 //$$

Q1: Determine DTFS of the signal $x(n) = \cos(\pi n/3)$
 PLOT its magnitude and phase spectrum.

Sol: $x(n) = \cos(\pi n/3)$

$$\omega_0 = \pi/3 = 2\pi(1/6) \Rightarrow N = 6 \text{ samples/}$$

$$x(n) = \cos(\pi n/3) = \frac{e^{j(\pi n/3)} + e^{-j(\pi n/3)}}{2}$$

$$x(n) = \frac{1}{2} e^{j(\pi/3)n} + \frac{1}{2} e^{-j(\pi/3)n}$$

~~(1)~~ →

Therefore $x(1) = 1/2$ and $x(-1) = 1/2$

$$x(n) = \sum_{k=0}^{n-1} x(k) e^{j k \pi n}$$

$$x(n) = x(0) + x(1) e^{j(1)\pi n} + \dots$$

$$\therefore x(1) = x(4) = x(13) = \dots = 1/2$$

$$x(-1) = x(5) = x(11) = \dots = 1/2$$

Q2: $x(n) = \sin\left(\frac{4\pi n}{21}\right) + \cos\left(\frac{10\pi n}{21}\right) + 1$

Sol: $\omega_0 = \frac{4\pi}{21} = 2\pi\left(\frac{2}{21}\right) \Rightarrow \underline{\underline{N_1 = 21}}$

$$\omega_0 = \frac{10\pi}{21} = 2\pi\left(\frac{5}{21}\right) \Rightarrow \underline{\underline{N_2 = 21}}$$

$$\omega_0 = \text{GCD} [\omega_{01}, \omega_{02}] = \text{GCD} \left[\frac{4\pi}{21}, \frac{10\pi}{21} \right] = \frac{2\pi}{21} \neq$$

$$N = \text{LCM} [N_1, N_2] = \text{LCM} [21, 21] = 21 \neq$$

$$x(n) = \sin\left(\frac{4\pi n}{21}\right) + \cos\left(\frac{10\pi n}{21}\right) + 1$$

$$x(n) = e^{j(\omega_0 n / 21)} - e^{-j(\omega_0 n / 21)} + e^{j(\omega_0 n / 21)} + e^{-j(\omega_0 n / 21)} + 1$$

$$x(n) = \frac{1}{2j} e^{j(2)(\omega_0 n / 21)} - \frac{1}{2j} e^{j(-2)(\omega_0 n / 21)} + \frac{1}{2} e^{j(0)(\omega_0 n / 21)}$$

$$+ \frac{1}{2} e^{j(\frac{\pi}{4})(2\pi/2)^n} + 1$$

$x(0) \neq 0$ therefore

$x(2) = 1/2j$	$x(-2) = -1/2j$	$x(5) = 1/2$	$y(-5) = 1/2$
and $x(0) = 1$.		$ x(k) $	$ y(k) $
$x(2) = 1/2j$		$ x(2) = 1/2$	$0 \rightarrow 90^\circ$
$x(-2) = -1/2j$		$ x(-2) = 1/2$	$0 \rightarrow 90^\circ$
$x(5) = 1/2$		$ x(5) = 1/2$	0
$x(-5) = 1/2$		$ x(-5) = 1/2$	0
$x(0) = 1$		$ x(0) = 1$	0

Q3: $x(n) = 2 + 2 \cos\left(\frac{\pi n}{4}\right) + \cos\left(\frac{\pi n}{2}\right) + \frac{1}{2} \cos\left(\frac{3\pi n}{4}\right)$. Evaluate the power of the signal.

Sketch the power density spectrum.

$$\text{Sol: } \omega_{01} = \frac{\pi}{4} = 2\pi \left(\frac{1}{8}\right) \Rightarrow N_1 = \underline{\underline{8}}$$

$$\omega_{02} = \frac{\pi}{2} = 2\pi \left(\frac{1}{4}\right) \Rightarrow N_2 = \underline{\underline{4}}$$

$$\omega_{03} = \frac{3\pi}{4} = 2\pi \left(\frac{3}{8}\right) \Rightarrow N_3 = \underline{\underline{8}}$$

$$\omega_0 = \text{GCD} [\omega_{01}, \omega_{02}, \omega_{03}] = \text{GCD} \left[\frac{\pi}{4}, \frac{\pi}{2}, \frac{3\pi}{4} \right] = \frac{\pi}{4} //$$

$$N = \text{LCM} [N_1, N_2, N_3] = \text{LCM} [8, 4, 8] = 8 //$$

$$x(n) = 2 + 2 \cos\left(\frac{\pi n}{4}\right) + \cos\left(\frac{\pi n}{2}\right) + \frac{1}{2} \cos\left(\frac{3\pi n}{4}\right)$$

$$x(n) = 2 + 2 \frac{e^{j(\pi n/4)} + e^{-j(\pi n/4)}}{2} + \frac{e^{j(\pi n/2)} + e^{-j(\pi n/2)}}{2} + \frac{1}{2} \frac{e^{j(3\pi n/4)} + e^{-j(3\pi n/4)}}{2}$$

$$x(n) = 2 + e^{j(1)(\pi/4)n} + e^{j(-1)(\pi/4)n} + \frac{1}{2} e^{j(2)(\pi/4)n} + \frac{1}{2} e^{j(-2)(\pi/4)n} + \frac{1}{4} e^{j(3)(\pi/4)n} + \frac{1}{4} e^{j(-3)(\pi/4)n}$$

$$\therefore x(0) = 2$$

$$|x(0)|^2 = 4$$

$$x(1) = 1$$

$$|x(1)|^2 = 1$$

$$x(-1) = 1$$

$$|x(-1)|^2 = 1$$

$$x(2) = 1/2$$

$$|x(2)|^2 = 1/4$$

$$x(-2) = 1/2$$

$$|x(-2)|^2 = 1/4$$

$$x(3) = 1/4$$

$$|x(3)|^2 = 1/16$$

$$x(-3) = 1/4$$

$$|x(-3)|^2 = 1/16$$

Power of the signal

$$P = \sum_{k=-N}^N |x(k)|^2 = 4 + 1 + 1 + 1/4 + 1/4 + 1/16 + 1/16 = \underline{\underline{53/8}}$$

Applications of Fourier Transform

Sampling Theorem:

ω_m : maximum signal frequency of message signal.

ω_s : sampled frequency.

$$s(t) = m(t) \cdot c(t)$$

$$s(\omega) = [m(\omega) * c(\omega)] \quad (\because c(\omega) = \sum_{n=-\infty}^{\infty} \delta(\omega - n\omega_s))$$

$$s(\omega) = \frac{1}{2\pi} [m(\omega) * \omega_s \sum_{n=-\infty}^{\infty} \delta(\omega - n\omega_s)]$$

$$s(\omega) = \frac{\omega_s}{2\pi} \sum_{n=-\infty}^{\infty} [m(\omega) + \delta(\omega - n\omega_s)]$$

$$s(\omega) = \frac{1}{T_s} \sum_{n=-\infty}^{\infty} m(\omega - n\omega_s)$$

$$s(\omega) = \frac{1}{T_s} [m(\omega + \omega_s) + m(\omega) + m(\omega - \omega_s) \dots]$$

condition

$$\omega_s \geq 2\omega_m; f_s \geq 2f_m$$

A: $x(t) = \cos(5\pi t) + 0.5 \cos(10\pi t)$ is ideally sampled with sampling period T_s . Find the sampling frequency and Nyquist rate.

Sol: $\omega_1 = 5\pi$ and $\omega_2 = 10\pi$
 $\omega_s \geq 2\omega_m$
 $\omega_s = 20\pi$

Frequency

$$f_s = \frac{\omega_s}{2\pi} = \frac{20\pi}{2\pi} = 10 \text{ Hz}$$

B: specify the Nyquist rate

i. $x_1(t) = \text{sinc}(200t)$

NOTE:

ii. $x_2(t) = \text{sinc}^2(200t)$

$$\text{sinc}\theta = \frac{\sin(\pi\theta)}{\pi\theta}$$

Sol: i. $x_1(t) = \text{sinc}(200t)$

$$x_1(t) = \frac{\sin(200\pi t)}{\pi t}$$

$$\omega_m = 200\pi$$

$$\omega_s \geq 200\pi (2)$$

$$\cdot \omega_s = 400\pi$$

$$f_s = \frac{\omega_s}{2\pi} = \frac{400\pi}{2\pi} = 200 \text{ Hz}$$

ii. $x_2(t) = \text{sinc}^2(200t)$

$$x_2(t) = \frac{\sin^2(200\pi t)}{\pi t} = \frac{1 - \cos(400\pi t)}{2\pi t}$$

$$\omega_m = 400\pi$$

$$\omega_s \geq 2\omega_m = 2(400\pi) = 800\pi$$

$$f_s = \frac{\omega_s}{2\pi} = \frac{800\pi}{2\pi} = 400 \text{ Hz}$$
